BIDIT

BidIt is a mobile application that provides a user friendly and secure approach to sell/buy products with an open ascending auction system. Users can bid on selling items, save them to their favourite list, monitor the seller reviews, and be notified about the updates of the related auctions and interactions with other users. **Bidit** also provides a safe and reliable payment flow that protects both the seller and the buyer.
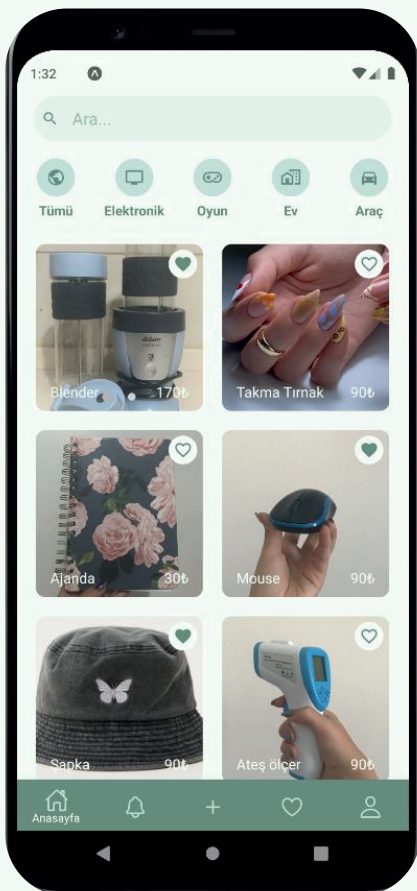

Main Flow

The seller creates an auction with a starting price and duration. The buyer is to bid higher than the current price. To perform that, the buyer has to have at least that amount in their wallet. Once the auction expires, the final amount will be deducted from the buyer's wallet. **Bidit** keeps the amount until the buyer approves proper delivery. Then, it will be reflected to the seller's wallet.
